

Telegram to MQL5

Version: 1.0 (2026) Author: Vincent TROLARD

Description: Telegram to MQL5 is an application that connects your Telegram account to MetaTrader 5 to automatically send commands to your Expert Advisors (EAs) and manage Telegram groups and messages directly from MetaTrader.

Installation

1. Download

- Download the executable **TelegramToMQL.exe** from the official site or project repository.

2. Run

- Double-click **TelegramToMQL.exe** to start the application.

3. First Launch

- On first launch, select your **MetaTrader 5 root folder** to allow communication with your Expert Advisors (EAs).
 - Connect your Telegram account and configure your groups.
-

Usage

1. Launch the application: TelegramToMQL.exe

2. Loading page:

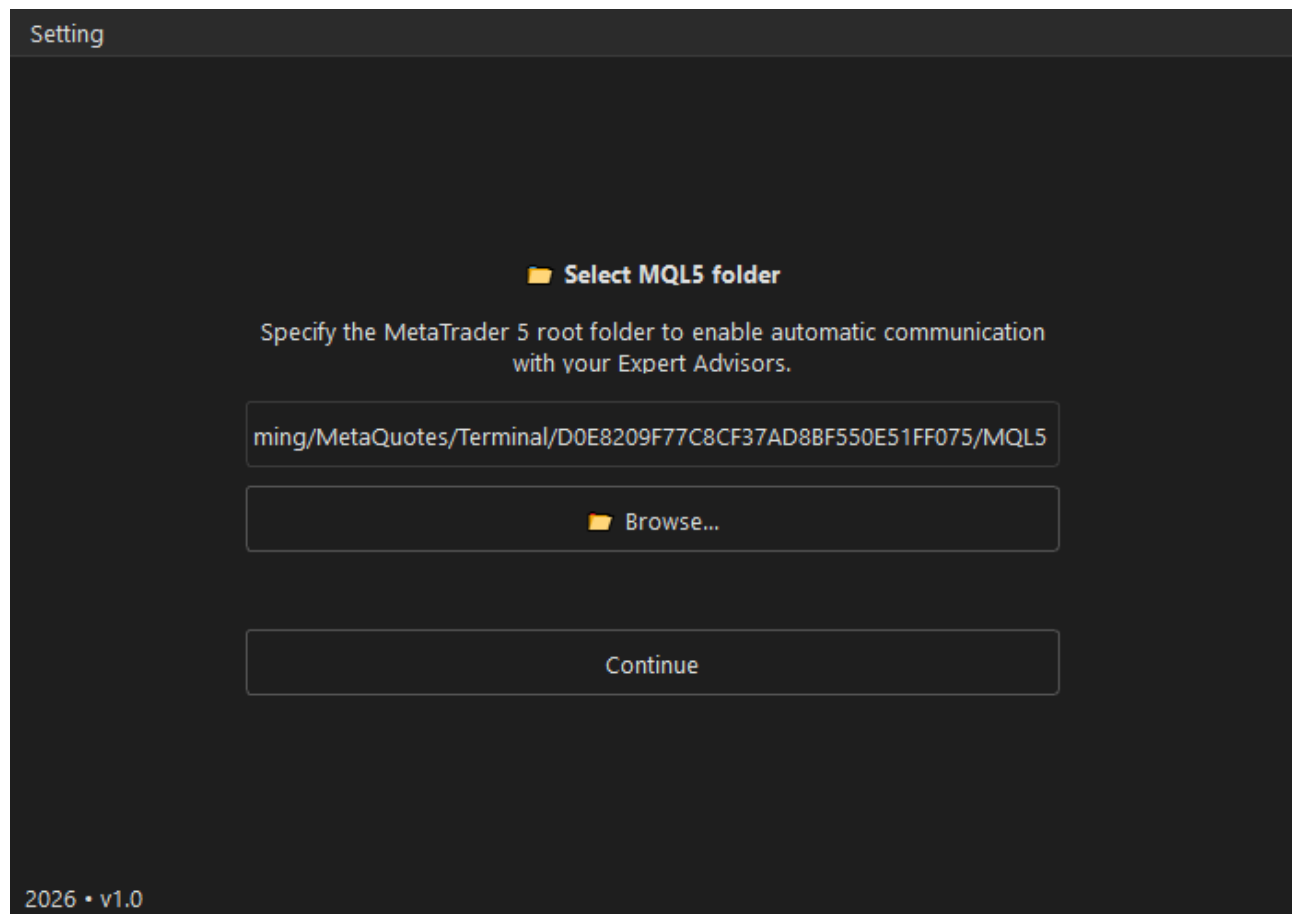

- Wait while the application starts.

3. Select MQL5 folder:

- Click  **Browse...** to select the root folder of MetaTrader 5. Default path:

C:\Users\AppData\Roaming\MetaQuotes\Terminal\MQL5\Experts

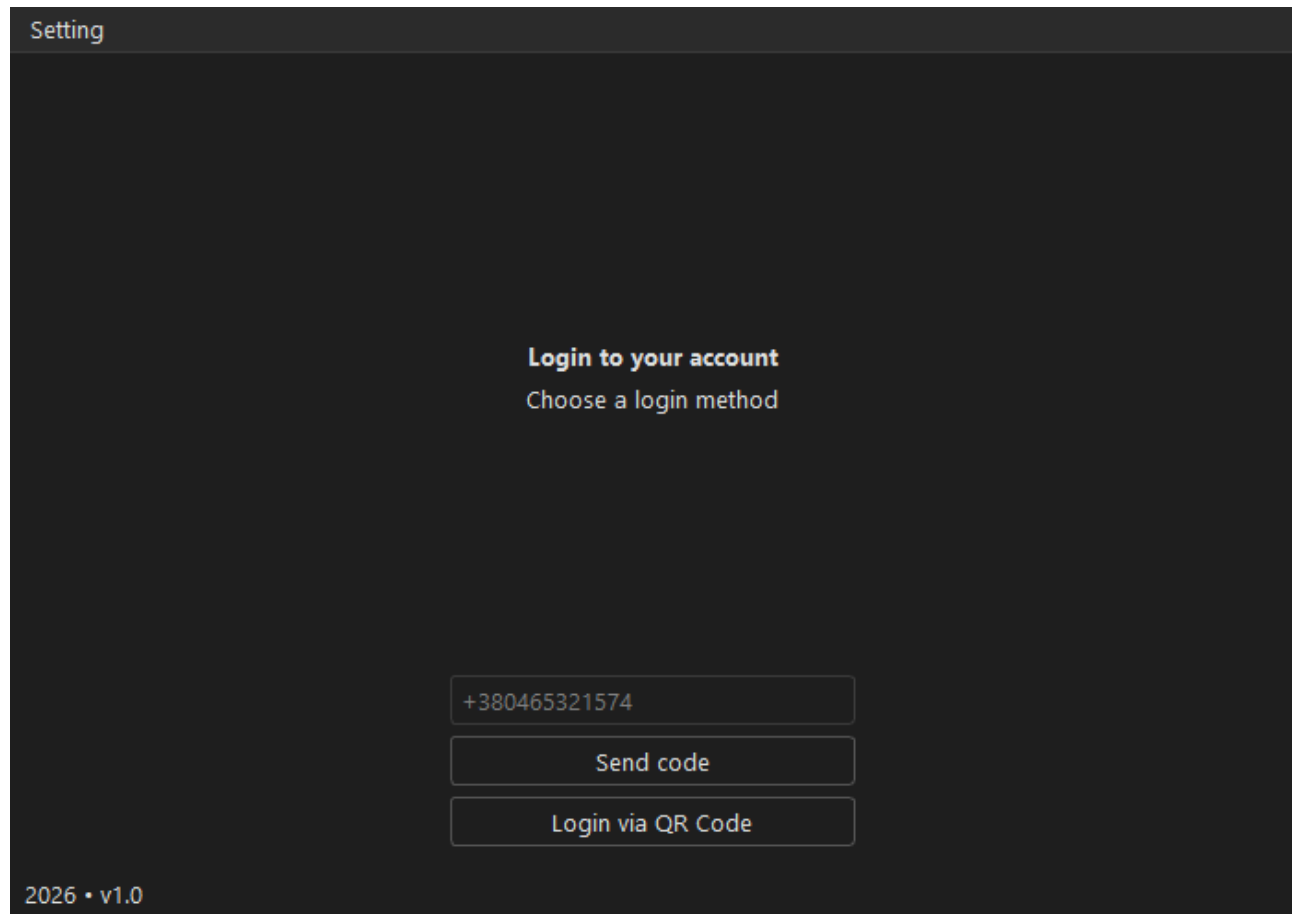

- Click **Continue** to proceed to the next page.
- **Menu:** You can change the folder anytime via **Menu** → **Change MQL Folder**.

Caption: Select the MetaTrader 5 folder where Expert Advisors are installed.

4. Telegram login:

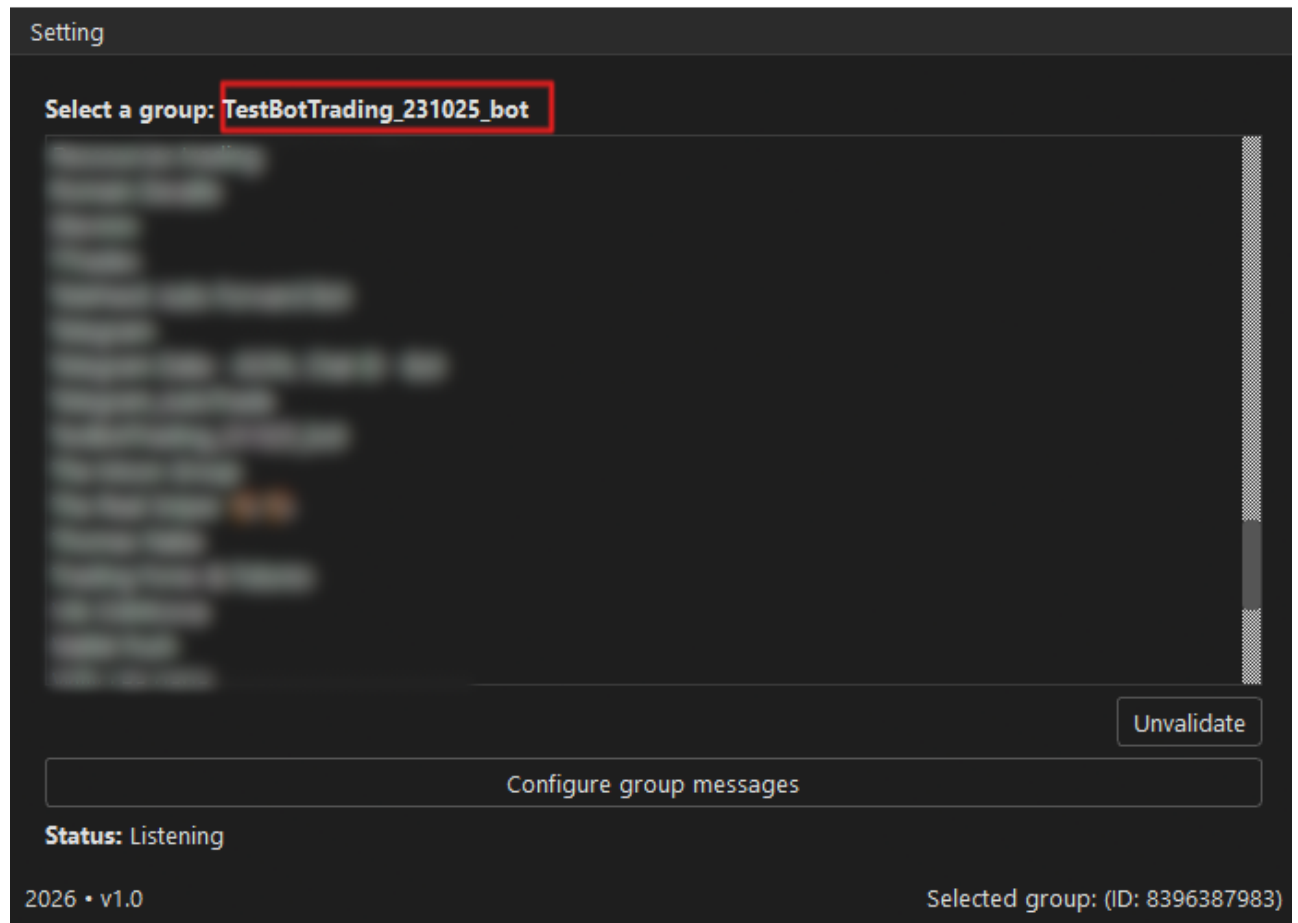

- Enter your phone number and click **Send code**, or use **Login via QR Code**.
- If you use the code, enter it in the field and click **Login**.

Caption: Login with phone number or QR code.

5. **Select Telegram groups:**

- Choose the group(s) you want to use.
- Click **Validate** to confirm.
- You can configure automated messages with **Configure group messages**.
- Once the group is selected and **Validate** is clicked, the group name will be displayed at the top.
- **Status Listening**: The program is now listening to the group. Incoming messages will be parsed.

Caption: Select the Telegram group(s) to parse messages from.

6. Track actions:

- Status information appears at the bottom of the interface (footer).

First Launch Recommendation (Important)

When launching **Telegram to MQL5** for the **first time**, the application performs initial setup steps such as:

- Connecting your **Telegram account**
- Saving the selected **MQL5 folder path**
- Initializing configuration files and communication channels

Recommended restart

After completing **Telegram login** and **MQL5 folder selection for the first time**, it is **strongly recommended to restart the application**.

Why restart?

- Ensures all configuration files are fully loaded
- Guarantees stable communication between:
 - Telegram
 - Telegram to MQL5 application
 - MetaTrader 5 Expert Advisor (EA)

- Prevents potential synchronization issues during the first session

✓ Best practice

1. Launch the application
2. Select the **MQL5 folder**
3. Log in to **Telegram**
4. Close the application
5. Relaunch **TelegramToMQL.exe**
6. Start listening to Telegram groups normally

⚠ This restart is only required on the **first launch** or after changing the **MQL5 folder**.

Message Customization

The application allows you to **configure your own keyword expressions** to automatically detect orders in Telegram messages.

Each type of information has its corresponding **key field**:

Key Field	Description	Default Example Values
Order Type Keyword	Words indicating order type (buy/sell)	buy, sell, achat, vente, long, short
Entry Price Keyword	Words indicating entry price	Entry zone, at, now, prix d entree, sell, buy, entry
Stop Loss Keyword	Words indicating stop loss	stop loss, stop-loss, sl, sl @, STOPLOSS, Stop
Take Profit Keyword	Words indicating take profits	take profit, TProfit, take-profit, tp, TakeProfit, TARGET
Symbol Keyword	Standard trading symbols	GOLD, BTC, EURUSD, USDJPY, XAUUSD, EURJPY, ETH
Custom Symbol Matches	Custom symbol mapping (e.g., GOLD → XAUUSD)	GOLD=XAUUSD, BTC=BTCUSD

Example of a valid message

```
XAUUSD BUY NOW 4409
❌ STOP LOSS 4394
✓ 1/ Take Profit 4415
✓ 2/ Take Profit 4425
✓ 3/ Take Profit 4460
```

Automatic interpretation:

- Symbol: **XAUUSD**
- Order Type: **BUY**
- Entry: **4409**
- Stop Loss: **4394**
- Take Profits: **4415, 4425, 4460**

✓ All information is found because keywords match the defaults.

Example of an invalid message

```
XAUUSD BU NOW 4409
X!! STOP LOSS 4394
✓ 1/ Take Profit 4415
✓ 2/ Take Profit 4425
✓ 3/ Take Profit 4460
```

Problem:

- **BU** does not match a valid order type keyword (**BUY, SELL, ...**).
- The application returns an error: **Order type cannot found in message.**

Solution:

- Add **BU** as a keyword in the **Order Type Keyword** field via **Configure group messages**:

```
Order Type Keyword: buy, BU, sell, achat, vente, long, short
```

- After this change, the message will be parsed correctly.

Customization Tips

1. **Add multiple synonyms**: separate with commas.
2. **Case sensitivity?** No, parsing is case-insensitive.
3. **Use custom symbols**: add them in **Custom Symbol Matches** using the format **NAME=MT5_SYMBOL**.
4. **Test messages**: send them in Telegram to verify parsing works.

MetaTrader

To communicate with MetaTrader and execute orders automatically, install the **Expert Advisor (EA)** **TelegramToMQL5.ex5** in the **Experts** folder of MetaTrader 5.

Steps

1. Open the MQL5 folder

- You selected the **MetaTrader 5 root folder** in the app (**Select MQL5 Folder**).

- Example: `C:\Users\<YourUser>\AppData\Roaming\MetaQuotes\Terminal\<YourTerminalID>\MQL5`

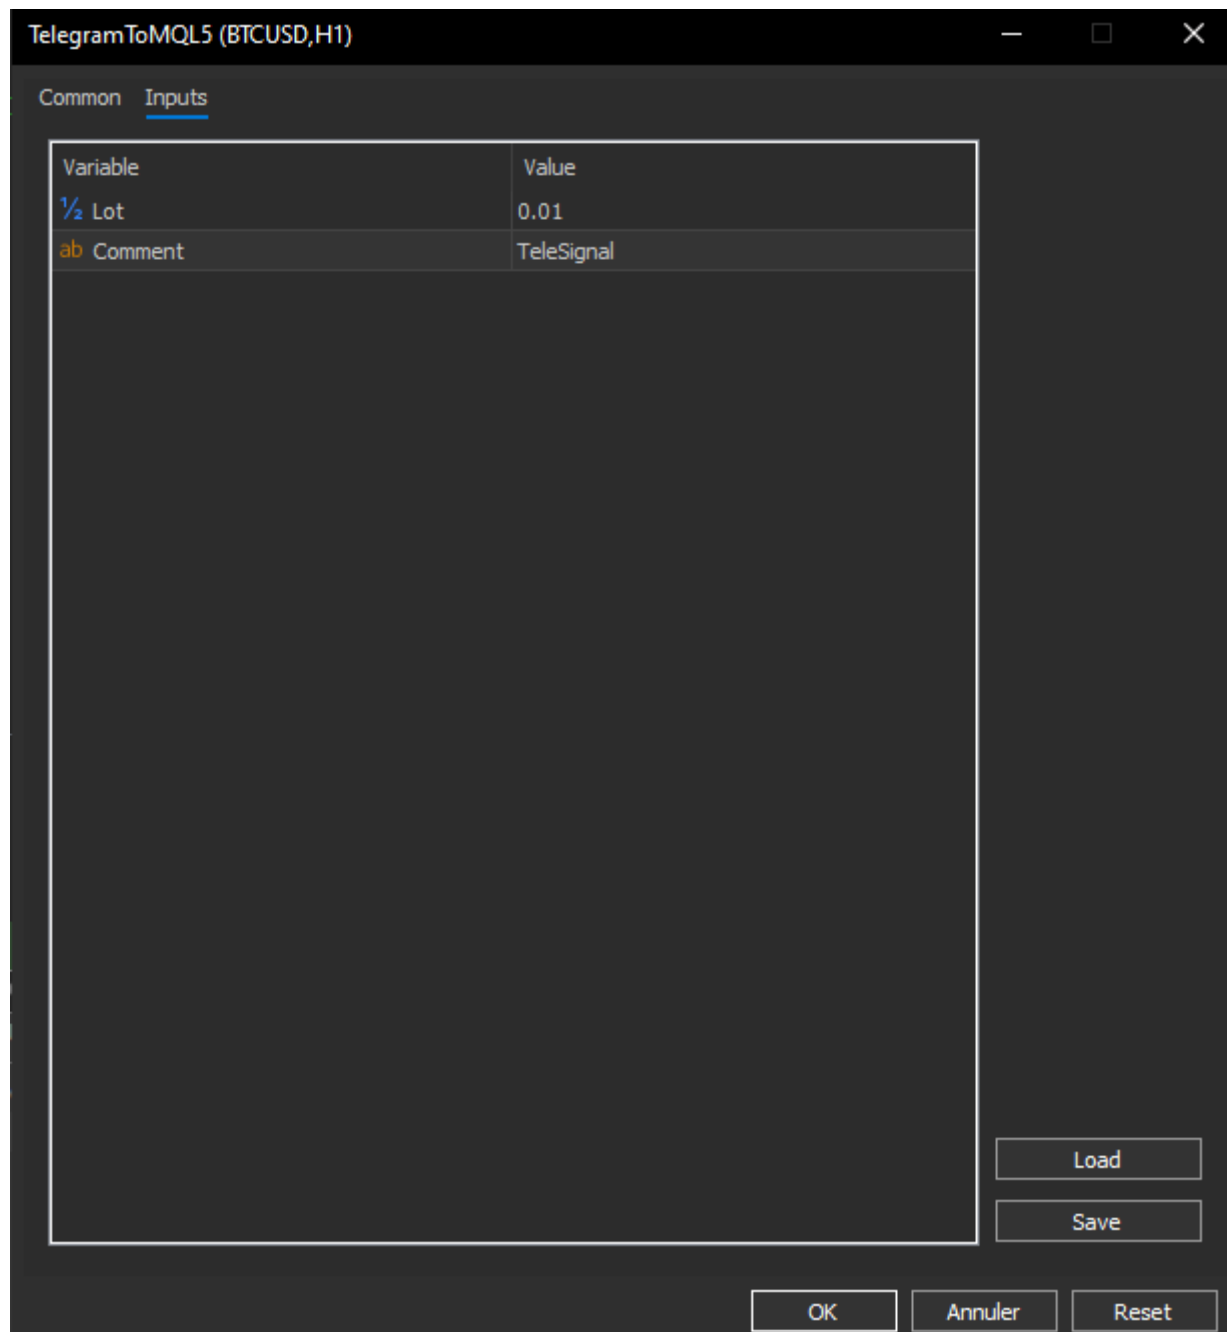

2. Place the EA in the **Experts** subfolder

- Inside the MQL5 folder: **Indicators**, **Scripts**, **Experts**, etc.
- Copy **TelegramToMQL5.ex5** into **Experts**.
- Final path:

```
<MQL5_Folder>\Experts\TelegramToMQL5.ex5
```

3. Configure the EA in MetaTrader 5

- Open MetaTrader 5.
- In the **Navigator (Ctrl+N)**, go to **Expert Advisors** → **TelegramToMQL5**.
- Drag and drop the EA onto a chart.
- In **EA Properties**, configure the two main inputs:
 - **lot** – lot size for trades
 - **comment** – optional comment to identify orders in history
- Ensure **Allow automated trading** is enabled.

Caption: Configure EA inputs for lot size and comment.

4. Test communication

- Once the EA is active, all orders detected by Telegram in the app will execute automatically.
- Messages are interpreted based on keywords configured in **Configure group messages**.

Important Notes

- **MQL5 folder must be correct**, otherwise the EA cannot receive instructions.
 - Place the EA on a chart (any symbol and timeframe works).
 - Adjust **lot** according to your risk management and capital.
 - **Comment** is optional but helps track orders in history.
-

Usage Tips

- Make sure MetaTrader 5 is closed or files are unlocked when selecting the folder.
 - Ensure your Telegram phone number is correct to receive the code.
 - Always select the **root folder** containing **MT5** to avoid EA communication issues.
-

FAQ

Q: Telegram code does not arrive? A: Check logs at
AppData/Roaming/TelegramMT5/logs/telegram_log.log

Q: Can I change the MT5 folder after first launch? A: Yes, use **Menu → Change MT5 Folder**.

Q: Works on Mac or Linux? A: Mainly tested on Windows; some features may need adjustments.
